

The role of genomics in international conservation policy

and useful tools to contribute to the field
with limited resources (ˆ ʘ ˆ)

A large orange circle with a white outline, partially visible on the left side of the slide.

We have already mentioned

- 1973: **CITES** (Convention on International Trade in Endangered Species of Wild Fauna and Flora)
- 1992: The Convention for Biological Diversity (**CBD**)
 - 2022: Kunming–Montreal Global Biodiversity Framework

Habitat Directive (1992)

- Merit: it transformed biodiversity conservation from mostly national action into a coordinated EU legal framework
- Ever since its adoption, genetics has not made it yet as a key tool for monitoring

Article 10

Member States shall endeavour, where they consider it necessary, in their land-use planning and development policies and, in particular, with a view to improving the ecological coherence of the Natura 2000 network, to encourage the management of features of the landscape which are of major importance for wild fauna and flora.

Such features are those which, by virtue of their linear and continuous structure (such as rivers with their banks or the traditional systems for marking field boundaries) or their function as stepping stones (such as ponds or small woods), are essential for the migration, dispersal and genetic exchange of wild species.

EU strategy for biodiversity 2030

English version [here](#)

2.2.2. Bringing nature back to agricultural land

The decline of **genetic diversity** must also be reversed, including by facilitating the use of traditional varieties of crops and breeds. This would also bring health benefits through more varied and nutritious diets. The Commission is considering the revision of marketing rules for traditional crop varieties in order to contribute to their conservation and sustainable use. The Commission will also take measures to facilitate the registration of seed varieties, including for organic farming, and to ensure easier market access for traditional and locally adapted varieties.

What can a conservation
genetics lab if limited
infrastructure and
resources are available?

Some
suggestions...

- Be creative

+

+

Some suggestions...

- Find rich collaborators :D
- Look for ready-to-use datasets (e.g. Zenodo, Figshare, Dryad)
- Use online resources:
 - Galaxy ([training](#) and [tools](#))
 - CCGenetics [resources](#)
- If you have some funding, use external clusters for a limited time (e.g. AWS)
